Three dimensional structure of the transmembrane region of the proto-
orgenic and oncogenic forms of the new protein.";

EMBO J. 11:43-48 (1992).

-!- FUNCTION: ESSENTIAL COMPONENT OF A NEUREGULIN-RECEPTOR COMPLEX,

ALTHOGHEN NEUREGULIN.

-!- FUNCTION: ESSENTIAL CAPPONENT OF A NEUREGULIN-RECEPTOR COMPLEX,

ALPHA AND AMPHIREGULIN.

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein

-!- SUBGNIT: HETERODIMER WITH EACH OF THE OTHER ERBB RECEPTORS.

-!- SUBGNIT: HETERODIMER WITH EACH OF THE OTHER ERBB RECEPTORS.

-!- SUBCLILULAR LOCATION: Type I membrane protein.

-!- FUNCTION: Type I membrane protein.

-!- PTM: LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE

RESIDUES. (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. Goning and activation of the Syrian hamster neu proto-oncogene.";
Gene 140:251-255 (1994).
I- PUNCTION: ESSENTIAL COMPONENT OF A NEUREGULIN-RECEPTOR COMPLEX,
ALTHOUGHT NEUREGULINS DO NOT INTERACT WITH IT ALONE: GP30 IS A
POTENTIAL LIGAND FOR THIS RECEPTOR. NOT ACTIVATED BY EGF, TGF-
ALPHA AND AMPHIREGULIN (BY SIMILARITY).
I- CATALYTIC ACTIVITY: ATP + a protein tyrosine phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi;

Biochem. 56:881-914(1987).

PUNCTION: Receptor for EGF, but also for other members of the EGF family, as TGF-alpha, amphiregulin, betacellulin, heparin-binding EGF-like growth factor, GP30 and vaccinia virus growth factor. Is EGF-like growth factor is call growth and differentiation. FUNCTION: Isoform 2/tuncated isoform may act as an antagonist. CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sato C., Kim J.-H., Abe Y., Saito K., Yokoyama S., Kohda D., "Characterization of the N-oligosaccharides attached to the atypical Asn-X-Cys sequence of recombinant human epidermal growth factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDLINE=96398132; PubMed=8962717; Smith K.D., Davies M.J., Bailey D., Renouf D.V., Hounsell E.F.; "Analysis of the glycosylation patterns of the extracellular domain the epidermal growth factor receptor expressed in Chinese hamster

TISSUE SPECIFICITY: Expressed in placenta. Isoform 2 is also expressed in ovarian cancers.
MISCELLANEOUS: Blanding of EGF to the receptor leads to dimerization, internalization of the EGF-receptor complex, induction of the tyrosaine kinase activity, stimulation of cell synthesis, and cell proliferation.
SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CARBOHYDRATE-LINKAGE SITES ASN-56; ASN-352; ASN-361; ASN-568 AND

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    à
                                                                                                                                                                                                                                                        RECEPPORS (POTENTIAL).

-!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- ALTERNATIVE PRODUCTS: 2 ISOFORMS; JAM-4 (SHOWN HERE) AND JM-B;

ARE PRODUCED BY ALTERNATIVE SPLICING. THE TWO ISOFORMS DIFFER FUNCTIONALLY IN THEIR RESPONSE TO PHORBOL ESTER: JM-A IS PROCESSED BUT NOT JM-B. SO, THEY RESPECTIVELY REPRESENT CLEAVABLE AND NONCLEAVABLE FORMS OF THE RECEPTOR. BOTH ISOFORMS ARE EXPRESSED IN CEREBELLUM, BUT ONLY THE JM-B ISOFORM IS BXPRESSED IN THE HEART.

-!- TISSUE SPECIFICITY: EXPRESSED AT HIGHEST LEVELS IN BRAIN, HEART, RIDITARY, SPLEEN, TESTIS AND BREAST. LOWER LEVELS IN THYMUS, LUNG, SALIVARY GIAND AND PANCREAS.

-!- THE LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. Carroll S.L., Miller M.L., Frohnert P.W., Kim S.S., Corbett J.A.;
"Expression of neureguline and their putative receptors, ErbB2 and
ErbB3, is induced duting Wallerian degeneration.";
J. Neurosci. 17:1642-1659(1997)
-!- FUNCTION: SPECIFICALLY BINDS AND IS ACTIVATED BY NEUREGULINS, NRG-2, NRG-3, HEPARIN-BINDING EGF-LIKE GROWHT FACTOR, BETARCELLUIN AND
NTAK. INTERACTION WITH THESE FACTORS INDUCES CELL DIFFERENCIATION.
NOT ACTIVATED BY EGF, TGF-A, AND AMPHIREGULIN (BY SIMILARITY).
-!- CARALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RECEPTORS (POTENTIAL).
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUB SPECIFICITY: PREFERENTIALLY EXPRESSED IN THE DEVELOPING
NERVOUS SYSTEM. EXHIBITS DISTINCT AND HIGHLY REGIONALIZED PATTERNS
OF EXPRESSION IN THE ADULT BRAIN, WHERE IT IS MAINLY FOUND IN THE
RETICULAR NUCLEUS OF THE THALLAMUS. VERY LOW LEVELS IN KIDNEY, AND
                                                                      Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              epidermal growth factor receptor homolog precursor - rat
N;Alternate names: ErbB3 protein; HER3 protein
C;Species: Rattus norvegicus (Norway rat)
C;Date: 17-Jan-1996 #sequence_revision 19-Apr-1996 #text_change 13-Nov-1998
C;Accession: JG3387
R;Hellyer: N.J.; Kim, H.H.; Greaves, C.H.; Sierke, S.L.; Koland, J.G.
Gene 165, 279-284, 1995
A;Title: Cloning of the rat ErbB3 cDNA and characterization of the recombinant protein.

A;Note: in Genbank entry CHKERBBF, release 109.0, the source is designated as Gallus gal
C;Comment: This protein is synthesized as a gag-env-erbB protein.
C;Genetics:
A;Gene: gag-env-erbB
C;Superfamily: epidermal growth factor receptor; protein kinase homology
C;Keywords: ATP; oncogene; phosphotransferase; transforming protein; tyrosine-specific p
F;1-6;Product: gag protein (fragment) #status predicted <br/>F;1-59/Product: protein-tyrosine kinase erbB #status predicted <br/>F;202-210/Region: protein kinase ATP-binding motif<br/>F;229/Active site: Lys #status predicted
